AB The first results of a rational hit-finding strategy to design novel small mol. antiinflammatory drugs targeting selectins, a family of three cellular adhesion mols., are described. Based on recent progress in understanding of mol. interaction between selectins and their natural ligands as well as progress in clin. development of synthetic antagonists, such as bimosiamose (TBC1269), this study was initiated to discover small mol. selectin antagonists with improved pharmacol. properties. Considering bimosiamose as template structure, a ligand-based approach followed by focused chemical synthesis has been applied to yield novel synthetic small mols. (MWr < 500) with a trihydroxybenzene motif, bearing neither peptidic nor glycosidic components, with nanomolar in vitro activity. Biol. evaluation involves two kinds of in vitro assays, a static mol. binding assay, and a dynamic HL-60 cell attachment assay. As compared to controls, the novel compds. showed improved biol. in vitro activity both under static and dynamic conditions.

Thus, miriamide Me ester (II) (3 µg/leaf) strongly inhibited oviposition by P. brassicae on leaves of Brussels sprouts. II was prepared by 2-nitration of Me 3,5-

dimethoxybenzoate, reduction to the amine, condensation with 3,4,5trimethoxycinnamic acid chloride, and demethylation with BBr3.

The structure-activity relation was investigated of compds. isolated from eggs AB of P. brassicae, the large white cabbage butterfly, and 8 synthesized related compds. as oviposition deterrents for this insect. The activity of all compds. was tested in a dual-choice bioassay. The 2 most active oviposition deterrents for P. brassicae were trans-2-[3-(4-hydroxyphenylproenoyl)amino]-3,5-dihydroxybenzoic acid and trans-2-[3-(3,4-dihydroxyphenylpropenoyl)amino]-3,5-dihydroxybenzoic acid. Among members of this compound class, alteration of the substituents of the cinnamic acid part of the mol. affected the oviposition deterrent activity more profoundly than other structural changes. Modification of the anthranilic acid part of the mol. resulted in lower activity.

AB The large white butterfly, P. brassicae, a herbivorous pest of crucifers, produces egg-associated chemical markers that inhibit its oviposition. The identification of the marker compds. is reported herein. Separation by reversed-phase HPLC demonstrated the presence of 3 active substances, which were identified as trans-2[3-(3,4,5-trihydroxyphenylpropenoyl)amino]- 3,5dihydroxybenzoic acid (I, R = OH), trans-2-[3-(3,4-dihydroxy-5- $\beta$ glucopyranosylphenylpropenoyl)amino] - 3,5-dihydroxybenzoic acid (I,  $R = O-\beta$ glucopyranosyl) and trans-2-[3-(3,4-dihydroxyphenylpropenoyl)amino]-3,5dihydroxybenzoic acid (I R = H), using mass and NMR spectroscopy and chemical synthesis. I have not been reported from the animal kingdom before. I are produced by 2 related Pieris species. This is the 1st report of taxonspecific compds. affecting oviposition behavior. The availability, stability, and inhibitory action on colonization of cabbage plants by butterflies make application of these compds. in the protection of cabbage crops feasible and comparable with other environmentally safe crop protection strategies. 153698-89-6P

AB Miriamide, 5-dehydroxymiriamide and miriamide 5-glucoside were isolated as oviposition-deterring, i.e. host-marking pheromones, from Pieris brassicae eggs. The synthesis of miriamide is outlined. Gas-chromatog, headspace anal. indicated the presence of unidentified cabbage leaf components, attractive to the parasitic wasp Cotesia glomerata. E3, Z7-14:Ac was identified and synthesized as the sex attractant pheromone of Symmetrischema tangolias females. Semiochems. of cabbage and associated insects, are discussed.
